200 m<sup>2</sup>

This house is one of the first certified passive houses to be built in Denmark, with an energy of max. 15 kw per year. The house is a typical detached house of 150 sqm, which can be adapted to suit most locations in Denmark. Its open plan living suits the demands of the modern family. It is a functional and inspiring home.

The house reads as a simple volume in the landscape, with contemporary high windows and high ceilings which maximise solar gain.

The design focuses on daylight qualities where power consumption is minimal and keeping a high comfort level. The dwelling is orientated around a central intelligent wall which houses technical services and creates interesting spaces. The building is constructed from grey faced brick and has a single sided sloping roof.
